Project 2 Team Workflow

Setup

1. Accept the GitHub invite, then clone:

```
git clone https://github.com/jrinck7/CSCI502_Project2.git
```

2. Build the images, in order:

```
docker build -t gds-qgis:latest ./gds-qgis
docker build -t gds-project2 .
```

3. Run it:

```
docker run -it --rm -p 8888:8888 -v "<your-repo-path>:/home/jovyan/work" gds-project2
```

4. Open the link it prints in your browser.

Data

- Source links for each dataset are in the notebook's opening cells.
- Download files into a local `data/` folder inside the repo — it's git-ignored, so this stays on your machine only.

Notebook format

- The notebook is tracked in git as a plain-text `.py` script (via Jupytext), not the `.ipynb` — this keeps diffs clean and avoids merge conflicts from cell outputs.
- To open it: in a container terminal, run `jupytext --to notebook Project2.py`, then open the generated `.ipynb` normally.
- Never commit the `.ipynb` — only the `.py`.

Daily workflow

1. `git checkout main && git pull`
2. `git checkout -b your-task-name`
3. Commit in small chunks: `git add . && git commit -m "..."`
4. `git push -u origin your-task-name`
5. Open a pull request on GitHub, tag a teammate to review
6. Merge once approved, delete the branch

Task split

Task	Owner
Data cleaning & joins	Jansen
Spatial analysis	TBD
Visualization & write-up	TBD

Shared functions go in `helpers.py`, imported by everyone's script.
